

Easy way to remember Strassen's Matrix Equation

 [geeksforgeeks.org/easy-way-remember-strassens-matrix-equation](https://www.geeksforgeeks.org/easy-way-remember-strassens-matrix-equation)

March 3,
2017

Strassen's matrix is a Divide and Conquer method that helps us to multiply two matrices (of size $n \times n$).

You can refer to the link, for having the knowledge about Strassen's Matrix first : [Divide and Conquer | Set 5 \(Strassen's Matrix Multiplication\)](#)

But this method needs to cram few equations, so I'll tell you the simplest way to remember those :

$$\begin{aligned} p1 &= a(f - h) & p2 &= (a + b)h \\ p3 &= (c + d)e & p4 &= d(g - e) \\ p5 &= (a + d)(e + h) & p6 &= (b - d)(g + h) \\ p7 &= (a - c)(e + f) \end{aligned}$$

The $A \times B$ can be calculated using above seven multiplications.
Following are values of four sub-matrices of result C

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix} \underset{X}{\times} \begin{bmatrix} e & f \\ g & h \end{bmatrix} \underset{Y}{=} \begin{bmatrix} p5 + p4 - p2 + p6 & p1 + p2 \\ p3 + p4 & p1 + p5 - p3 - p7 \end{bmatrix} \underset{C}{}$$

X , Y and C are square matrices of size $N \times N$
 a , b , c and d are submatrices of A , of size $N/2 \times N/2$
 e , f , g and h are submatrices of B , of size $N/2 \times N/2$
 $p1$, $p2$, $p3$, $p4$, $p5$, $p6$ and $p7$ are submatrices of size $N/2 \times N/2$

You just need to remember 4 Rules :

- AHED (Learn it as 'Ahead')
- Diagonal
- Last CR
- First CR

Also, consider X as (Row +) and Y as (Column -) matrix

Follow the Steps :

- Write $P1 = A$; $P2 = H$; $P3 = E$; $P4 = D$
- For $P5$ we will use Diagonal Rule i.e.
(Sum the Diagonal Elements Of Matrix X) * (Sum the Diagonal Elements Of Matrix Y), we get
 $P5 = (A + D) * (E + H)$

$$X = \begin{bmatrix} A & B \\ C & D \end{bmatrix}$$

$$Y = \begin{bmatrix} E & F \\ G & H \end{bmatrix}$$

-AHED
-Diagonals
-Last CR
-First CR

$$\begin{aligned} P1 &= A \\ P2 &= H \\ P3 &= E \\ P4 &= D \\ P5 &= (A + D) * (E + H) \end{aligned}$$

- For $P6$ we will use Last CR Rule i.e. Last Column of X and Last Row of Y and remember that Row+ and Column- so i.e. $(B - D) * (G + H)$, we get
 $P6 = (B - D) * (G + H)$
- For $P7$ we will use First CR Rule i.e. First Column of X and First Row of Y and remember that Row+ and Column- so i.e. $(A - C) * (E + F)$, we get
 $P6 = (A - C) * (E + F)$

Check for Row (+)

$$X = \begin{bmatrix} A & B \\ C & D \end{bmatrix}$$

Check for Column (-)

$$Y = \begin{bmatrix} E & F \\ G & H \end{bmatrix}$$

-AHED
-Diagonals
-Last CR
-First CR

$$\begin{aligned} P1 &= A \\ P2 &= H \\ P3 &= E \\ P4 &= D \\ P5 &= (A + D) * (E + H) \\ P6 &= (B - D) * (G + H) \\ P7 &= (A - C) * (E + F) \end{aligned}$$

- Come Back to P1 : we have A there and it's adjacent element in Y Matrix is E, since Y is Column Matrix so we select a column in Y such that E won't come, we find F H Column, so multiply A with (F - H)
So, finally $P1 = A * (F - H)$

Check for Row (+)

$$X = \begin{bmatrix} \textcircled{A} & B \\ C & D \end{bmatrix}$$

Check for Column (-)

$$Y = \begin{bmatrix} \textcircled{E} & \textcircled{F} \\ G & H \end{bmatrix}$$

-AHED
-Diagonals
-Last CR
-First CR

$$\begin{aligned} P1 &= A * (F - H) \\ P2 &= H \\ P3 &= E \\ P4 &= D \\ P5 &= (A + D) * (E + H) \\ P6 &= (B - D) * (G + H) \\ P7 &= (A - C) * (E + F) \end{aligned}$$

- Come Back to P2 : we have H there and it's adjacent element in X Matrix is D, since X is Row Matrix so we select a Row in X such that D won't come, we find A B Column, so multiply H with (A + B)
So, finally $P2 = H * (A + B)$
- Come Back to P3 : we have E there and it's adjacent element in X Matrix is A, since X is Row Matrix so we select a Row in X such that A won't come, we find C D Column, so multiply E with (C + D)
So, finally $P3 = E * (C + D)$

Check for Row (+)

$$X = \begin{bmatrix} \textcircled{A} & B \\ \textcircled{C} & \textcircled{D} \end{bmatrix}$$

Check for Column (-)

$$Y = \begin{bmatrix} \textcircled{E} & F \\ G & H \end{bmatrix}$$

-AHED
-Diagonals
-Last CR
-First CR

$$\begin{aligned} P1 &= A * (F - H) \\ P2 &= H * (A + B) \\ P3 &= E * (C + D) \\ P4 &= D \end{aligned}$$

$$P5 = (A + D) * (E + H)$$

$$P6 = (B - D) * (G + H)$$

$$P7 = (A - C) * (E + F)$$

- Come Back to P4 : we have D there and it's adjacent element in Y Matrix is H, since Y is Column Matrix so we select a column in Y such that H won't come, we find G E Column, so multiply D with (G - E)

$$\text{So, finally } P4 = D * (G - E)$$

We are done with P1 - P7 equations, so now we move to C1 - C4 equations in Final Matrix C :

- Remember Counting : Write P1 + P2 at C2
- Write P3 + P4 at its diagonal Position i.e. at C3
- Write P4 + P5 + P6 at 1st position and subtract P2 i.e. $C1 = P4 + P5 + P6 - P2$
- Write odd values at last Position with alternating - and + sign i.e. P1 P3 P5 P7 becomes

$$C4 = P1 - P3 + P5 - P7$$

$$XY = \begin{bmatrix} P6 + P5 + P4 - P2 & P1 + P2 \\ P3 + P4 & P1 + P5 - P3 - P7 \end{bmatrix}$$
